Pipe Stiffeners

Stainless steel inserts are used to reinforce HDPE and PVC pipes from the inside to allow the use of compression couplings.

Application:

Inserts are designed to reinforce pipe ends by providing inside support for HDPE or PVC pipes when pipe couplings or flange adapters are used for the connection of pipes.

The inserts are supplied with a wedge to overcome the tolerances in the plastic pipes. Low profile wall construction will not disturb the flow characteristics of the medium.

Pipe Inserts are made of stainless steel AISI 304.

Large Pipes may require more than two sections.
